

Neither LDT nor IES files support the ring shape of the INFORM R products, the light planner has to build up the lumininaire out of small rectangular pieces to get the desired result in his calculation.

If you use Relux, you do not need any build up because the geometry is constructed by the Relux plug-in. Just select the INFORM R3 you need from the list.

How to build up the INFORM R3 in **Dialux**:

For the INFORM R3, you need to import a single LDT file (rectangular segment) and place 8 segments in a Circular Arrangement with a radius of 0.385m.

You do this twice and remove 1 segment from each circle. Then you attach both constructions as illustrated.

The same method applies for the UP part.
